

WEEK-9 DAY-44 Hands On Keerthivasan R

Problem Statement

An organization maintains project data, user files, and system logs on a UNIX server. Due to improper file and directory management:

- Files are scattered across multiple folders.
- Incorrect permissions allow unauthorized access.
- Old log files consume excessive disk space.
- Users are unable to locate required files quickly.
- No structured backup process exists.

The organization needs a standardized UNIX-based solution to:

- Organize files and directories properly
 - Manage user permissions securely
 - Search and filter required files
 - Monitor disk usage
 - Perform backup and cleanup operations
-

Proposed Solution

Develop a structured approach using UNIX commands to manage files and directories effectively.

Key Operations to Implement:

1. **Create and manage directories**
 - `mkdir`, `rmdir`, `cd`, `pwd`
 2. **File handling**
 - `touch`, `cp`, `mv`, `rm`
 3. **Viewing file contents**
 - `cat`, `less`, `head`, `tail`
 4. **File permissions and ownership**
 - `chmod`, `chown`, `chgrp`
 5. **Searching and filtering**
 - `find`, `grep`
 6. **Disk usage monitoring**
 - `du`, `df`
 7. **Backup and compression**
 - `tar`, `gzip`
-

Functional Requirements

- Create structured project directories.
 - Assign appropriate read/write/execute permissions.
 - Search files based on name, size, or date.
 - Remove temporary and old log files.
 - Generate backup archives regularly.
-

Non-Functional Requirements

- Ensure data security.
 - Maintain system performance.
 - Prevent accidental data loss.
 - Optimize disk usage.
-

Expected Outcome

After implementing proper UNIX file and directory management:

- Files will be well organized.
- Security will improve through correct permissions.
- Disk space will be optimized.
- Backup and recovery processes will be streamlined.
- System administration efficiency will increase.
